

SIDEWALK ASSESSMENT AND PRORITIZATION PLAN

Town of Braintree, MA

April 2024

ENVIRONMENTAL
 **PARTNERS**

— An Apex Company —

INTRODUCTION

Environmental Partners Group, LLC (EP), was engaged by the Town of Braintree to complete an inventory and assessment of the Town's sidewalk network. The primary goal was to develop a Sidewalk Improvement Plan focusing on town-owned sidewalks. The purpose of this document is to furnish town personnel with comprehensive data regarding pedestrian infrastructure, aiding in the prioritization and enhancement of the pedestrian network. This analysis underscores the Town of Braintree's acknowledgment of the significance of sustaining a high quality pedestrian transportation system for both residents and visitors. The Town's sidewalks serve as vital links within the community and Braintree is committed to preserving and enhancing them through a transparent and consistent framework. This document is dynamic and subject to updates to align with an evolving network and Town requirements.

INVENTORY & DATA COLLECTION

The inventory and assessment of Town-owned sidewalks were completed by trained EP staff to gather information such as general condition, material type, and locations where maintenance activities can improve the accessible route. Sidewalk data was collected along Town-owned roadways using a specialized GIS program created to simplify the inventory and evaluation of assets.

The following attributes were collected for each sidewalk segment:

Existing Sidewalks

Material Type

- Cement Concrete
- Asphalt
- Brick
- Mixed materials
- Other

Width

- Average width of the sidewalk segment (measured to the nearest foot)

Grass Strip Present (Y/N)

- Whether or not a grass strip is present

General Condition

- Excellent - No distresses were observed on the sidewalk. Typically new and/or very well maintained segment.
- Good - No distresses were identified, up to minor surface blemishes and deterioration observed on sidewalk.

- Fair - Distresses started to develop but provide minimal to no impediment.
- Poor - Distresses and obstructions were actively observed, which made the sidewalk potentially hazardous for public use in certain areas.
- Repair/Replace Entire Segment - Major signs of failure that made sections of the sidewalk potentially hazardous for public use (60-100% of sidewalk requires repair).

Sidewalk Maintenance Locations

Sidewalk maintenance locations were identified on sidewalk segments that were deemed to have an overall condition of good or excellent. On these sidewalks, structural repairs may be addressed, rather than the replacement of the entire sidewalk segment as is required for sidewalks rated as fair, poor, or repair/replace entire segment.

The following attributes were collected for each sidewalk maintenance location:

Maintenance Issues

- Quick fixes, such as shrubbery overgrowing the sidewalk, overhanging tree branches, etc.

Structural Issues

- Locations of sidewalk deficiencies, such as cracks, depressions, lifted panels, etc. where a spot repair is needed.

Obstruction Issues

- Locations along the sidewalk where there is not adequate clearance for a wheelchair due to a vertical obstruction in the sidewalk, such as a fire hydrant or utility pole.

ANALYSIS & REPORTING

Existing Sidewalks

Sidewalks were digitized in a GIS environment to allow Town staff to understand where existing sidewalk segments are located and their general condition. This data will allow for the development of a plan for sidewalk repairs as well as analysis of where future sidewalks may be considered.

According to the inventory and assessment results, the Town of Braintree maintains approximately **150 miles** of sidewalk.

The majority of sidewalks were constructed using asphalt (about 85%) and approximately 38% of the sidewalks (by length) were found to be in good or excellent condition. See **Figure 1** for a breakdown of existing sidewalk materials and **Figure 2** for a breakdown of existing sidewalk conditions.

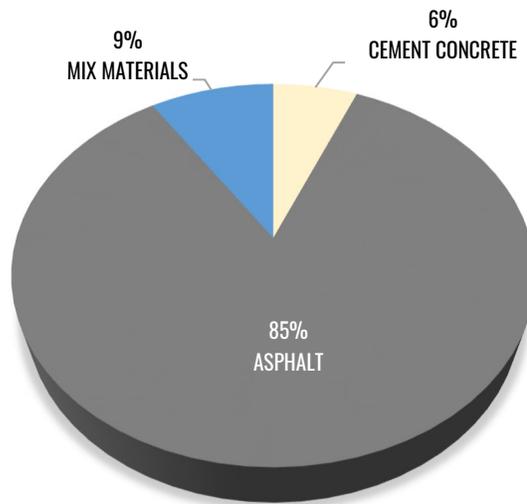

Figure 1: Material of Existing Sidewalks

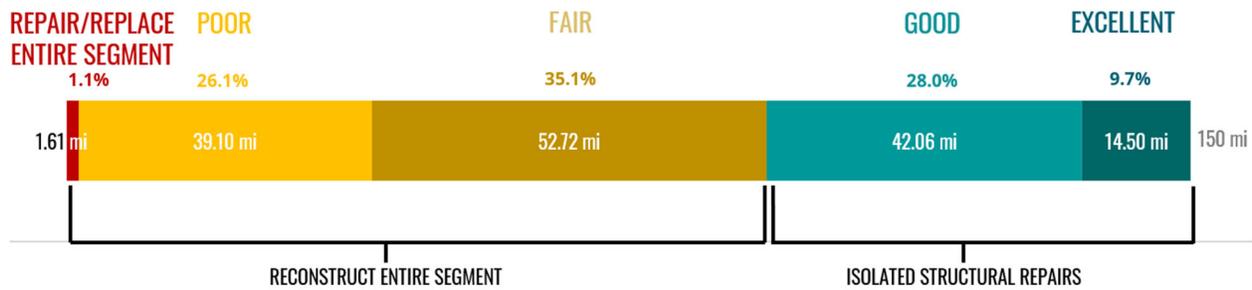

Figure 2: General Condition of Existing Sidewalks

Sidewalk Maintenance Locations

Sidewalk Maintenance Locations were also digitized in a GIS environment to allow Town staff to understand where isolated sidewalk repairs and maintenance work may be necessary.

Sidewalk maintenance locations were split into three categories: maintenance issues, structural issues, and obstruction issues. Sidewalks that were in excellent or good condition may not need to be reconstructed entirely in the near future. To improve the condition of these sidewalks, isolated spot repairs can be made when there are structural issues or obstructions. Simple maintenance issues, such as shrubbery overgrowing the sidewalk, overhanging tree branches, etc., can also be addressed on such sidewalks to improve the overall pedestrian network.

There were a total of **761** sidewalk maintenance points identified on existing sidewalk segments that were in excellent or good condition. The breakdown of those points are as follows:

Issue Type	Number of Points	Percent
Structural	702	92%
Obstruction	34	4%
Maintenance	25	3%
	<hr/> 761	

Table 1: Sidewalk Maintenance Location Summary

PRIORITIZATION CRITERIA

The prioritization of the sidewalk segments were calculated based on the following criteria based on discussions with the Department of Public Works.

1. Sidewalk Condition Index
2. Functional Classification
3. Pedestrian Usage Score
4. Sidewalk Width

Sidewalk Condition Index

Sidewalk condition data was compiled to facilitate the Sidewalk Condition Index (SCI) for each sidewalk segment. The SCI rates the overall sidewalk segment condition based on a 0 to 100 scale, with a minimum value of 0 meaning the sidewalk has severe distress or requires replacement, to a maximum value of 100 for a sidewalk identified as having no visible defects and requiring no maintenance at the time of inspection.

This number is calculated based on the condition of the sidewalk segment and factors in any structural issues along the sidewalk segment.

Functional Classification

Functional classification is the process by which roadways are grouped into classes according to the character of traffic service that they are intended to provide. Roadways are classified into three major categories: arterial, collector, and local. The amount of mobility and land access offered by each road type differs greatly. Arterials connect urbanized areas, cities, and industrial centers. Collectors provide traffic circulation within residential, commercial, and industrial areas and carry trips to and from arterials. Local roads provide limited mobility and are the primary access to residential areas.

The functional classification of a roadways helps to determine how much of a connection a sidewalk provides to the network, which helps to estimate foot traffic. For instance, sidewalks on local roadways will likely only serve the residents of that neighborhood, whereas sidewalks on arterial or collector roadways may see greater use as people will use that roadway to access different points of interest.

Pedestrian Usage Score

In order to prioritize the sidewalk segments and sidewalk maintenance locations for reconstruction and maintenance, each point of interest in Town was identified and assessed by assigning a spatial buffer and a priority ranking in relation to the overall network (ie. schools were given greater weight

than parks and playgrounds due to their significance as primary walking generators/destinations). The points of interest that were included are:

- Schools
- Parks
- Municipal Buildings
- Transit
- Commercial Areas
- Community Centers
- Long Term Care Facilities
- Senior Centers
- Affordable Housing

A complete list of all of the points of interest that were included in this analysis can be found in **Appendix F**.

A spatial buffer analysis was then conducted in GIS to assign a score to all areas of the Town to create a mapping layer to identify where pedestrian density is likely to be the highest. This produced the map as seen in **Figure 3: Pedestrian Usage Analysis Map**.

The Pedestrian Usage Analysis was then used to assign a Pedestrian Usage Score to each sidewalk segment in Town.

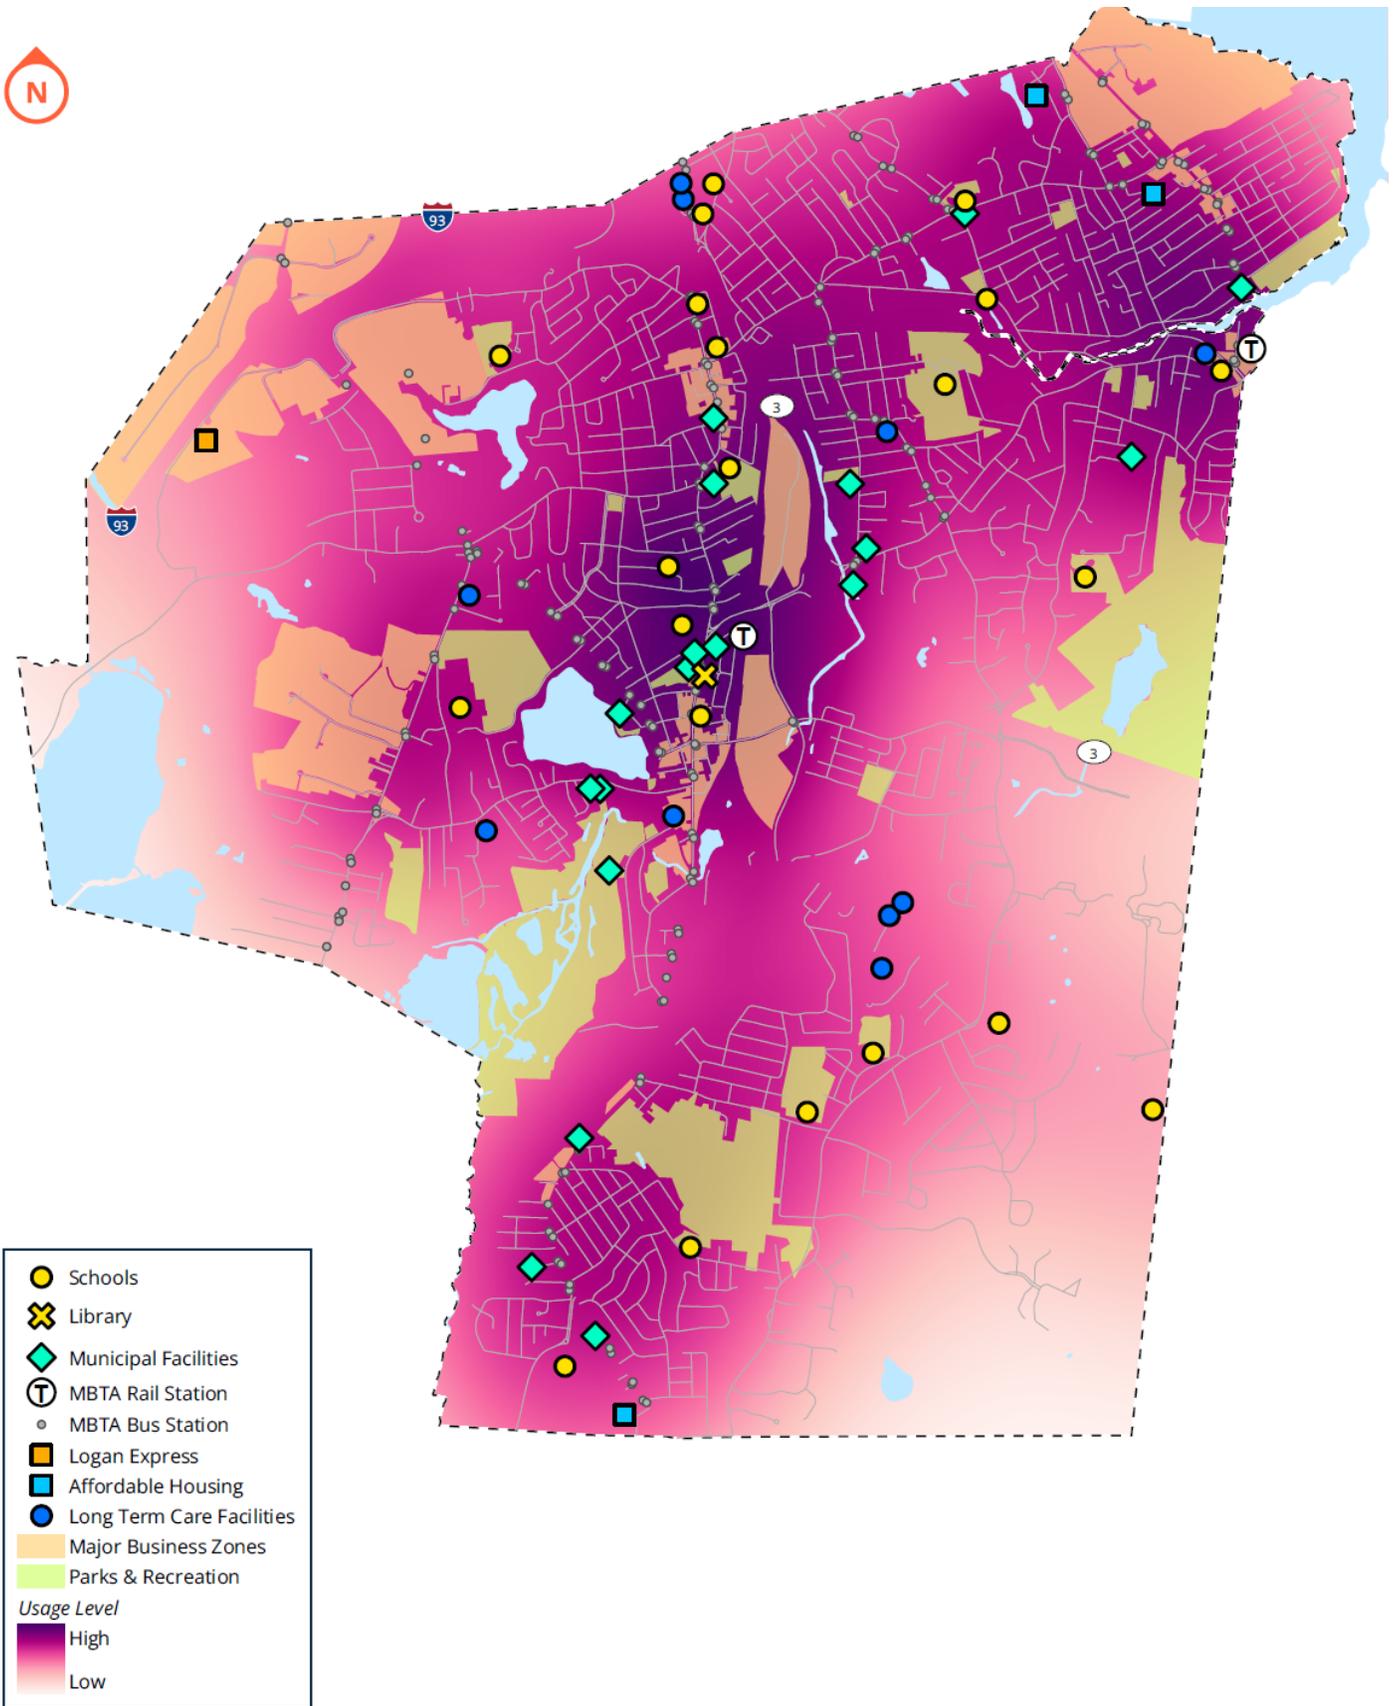

Figure 3: Pedestrian Usage Analysis Map

Sidewalk Width

The Americans with Disabilities Act (ADA) contains the federal Standards that ensure that sidewalks are constructed to be accessible for all. For ADA compliance, the minimum clear width of an accessible route shall be 36 inches (3 feet). If sidewalks are less than 60 inches (5 feet) wide, passing spaces must be constructed every 200 feet. These passing spaces need to be at least 60 inches (5 feet) on all sides.

To avoid the necessity for passing spaces and to assure that sidewalks have adequate width, sidewalks with a width less than 5 feet were prioritized higher for reconstruction. A sidewalk with a width of 5 feet meets both ADA Standards and MassDOT recommendations.

PRIORITIZATION METHODOLOGY

Existing Sidewalk Segments

The combination of the condition of the sidewalk segment, the functional classification of the roadway, the pedestrian usage score of the sidewalk segment, and the width of the sidewalk segment were used to rank the sidewalk segments and each of the components were weighted as follows:

From this an overall prioritization score is calculated out of 100, with the highest score being the highest priority and lowest score being the lowest priority. These scores are then sorted from highest to lowest in order to rank each sidewalk segment by priority. This ranking system prioritizes sidewalk condition foremost, followed by functional classification, then pedestrian usage score, and finally sidewalk width.

In general, this prioritization process ranks sidewalk segments in poor condition, on arterial roadways first, with the highest pedestrian usage scores, and narrowest sidewalks first, and sidewalk segments in good condition, on local roadways, with the lowest pedestrian usage scores, and adequate sidewalks width (greater than 5 feet) last. A map showing the prioritization scores of the existing sidewalk segments and a report showing the existing sidewalk segment ranking can be found in **Appendix A**.

Sidewalk Maintenance Locations

Sidewalk Maintenance Locations were prioritized based on the sidewalk rank of the sidewalk segment that the point in question resides on.

Proposed Sidewalk Segments

Braintree's existing sidewalk network has a few major gaps. Therefore, to improve connectivity of the pedestrian network, new sidewalk segments have been proposed where sidewalks could connect existing sidewalks to complete the pedestrian network.

Prioritization of sidewalk network gaps will follow the prioritization model used for existing sidewalks. However, the general condition of the sidewalk segment does not play a factor, nor does sidewalk width (since all new sidewalks will be constructed with adequate width). Proposed sidewalk segments are therefore ranked based on the functional classification of the roadway, which helps to determine how much of a connection a proposed sidewalk will provide to the network and the pedestrian usage score.

A total of approximately **18.10 miles** of new sidewalks were proposed to improve the pedestrian network. A map showing the prioritization scores of the proposed sidewalk segments and a report showing the proposed sidewalk segment ranking can be found in **Appendix E**.

COST ESTIMATE

Associated order-of-magnitude opinion of probable construction cost estimates for each sidewalk were prepared based on recent weighted average unit bid prices from MassDOT. These planning-level estimates are a function of the sidewalk lengths and widths, as obtained from the inventoried data. A detailed budget for any additional components will need to be established during later project-level contract development and cost estimating.

Assumptions

The following assumptions were made when calculating the unit costs for reconstruction of existing sidewalk segments, reconstruction of isolated structural maintenance locations, and the new construction of proposed sidewalk segments.

1. In general, sidewalk material will be replaced in kind, unless existing sidewalk is gravel or stone dust in which case it will be upgraded to asphalt, and if it is "mixed materials" it will be upgraded to concrete.
2. The cost of new sidewalks will be based on the unit cost of a 5 foot wide asphalt sidewalk with granite curbing, but a 30% contingency will be carried to account for any impacts that adding a new sidewalk may incur (ie. tree removal, utility poles, etc.).
3. 30% of sidewalk surface areas are calculated as driveway areas.
4. 1 foot of loam & seed blending is assumed behind sidewalks.
5. 3 feet of asphalt driveway blending is assumed behind driveways.
6. Over 50% of the existing sidewalks (by length) have non-granite curbing or no curbing; to remain conservative new granite curbing will be included in the cost of these sidewalks.
7. For sidewalks where there is existing granite curb in good condition it is assumed that 20% of the existing granite curb will be removed and reset and 80% will be retained.
8. For sidewalks where there is existing granite curb but the curb is in poor condition (less than 3 inch reveal) it is assumed that 100% of the existing granite curb will be removed and reset.
9. Driveway curb corners are not be budgeted for.
10. For isolated structural maintenance locations, a minimum length of 5 feet is assumed for reconstruction.
11. For isolated structural maintenance locations, new granite curb is assumed and a 30% contingency is carried to account for the higher price that isolated repair work typically incurs.

12. A 10% overall contingency is applied unless otherwise stated (ie. isolated structural maintenance locations and proposed sidewalk segments).

Unit Costs

Unit Cost	Units	Designation
\$306	\$/SY	Asphalt Sidewalks & Driveways with New Granite Curb
\$158	\$/SY	Asphalt Sidewalks & Driveways, R&R 20% Existing Curb
\$180	\$/SY	Asphalt Sidewalks & Driveways, R&R 100% Existing Curb
\$355	\$/SY	Concrete Sidewalks & Driveways with New Granite Curb
\$225	\$/SY	Concrete Sidewalks & Driveways, R&R 20% Existing Curb
\$229	\$/SY	Concrete Sidewalks & Driveways, R&R 100% Existing Curb
\$691	\$/SY	Brick Sidewalks & Concrete Driveways with New Granite Curb
\$356	\$/SY	New or Isolated Asphalt Sidewalks & Driveways with New Granite Curb
\$412	\$/SY	New or Isolated Concrete Sidewalks & Driveways with New Granite Curb

Table 2: Unit Costs

CONCLUDING REMARKS

The primary goal of developing a Sidewalk Improvement Plan was to assess existing sidewalks and to determine network gaps to inform a comprehensive improvement strategy.

As a result of the methodology discussed in this study for prioritizing individual sidewalk segments and sidewalk issue points, the following reports were produced:

- A. Sidewalk Segment Prioritization
- B. Sidewalk Structural Point Prioritization
- C. Sidewalk Maintenance Point Prioritization
- D. Sidewalk Obstruction Point Prioritization
- E. Proposed Sidewalk Segment Prioritization

This provides the Town with data-driven prioritized lists of projects to be considered for future construction and rehabilitation. These lists are meant to be used as guidance to assist the Town in

selecting future projects. However, the rank of a particular sidewalk segment is not the only factor that should be considered when determining which sidewalks will be reconstructed. Constructability and mobilization considerations, future project considerations, and engineering judgement should all be taken into account when formulating the final Sidewalk Improvement Plan.

Projects of similar nature should be grouped when possible. This approach leads to more favorable construction bid pricing and thus more infrastructure repairs. As a result, some top ranked sidewalk segments may not be selected for reconstruction because they are isolated segments that alone would not bring as much value to the overall network. Alternatively, sidewalk segments not ranked at the top of the list may be selected for reconstruction so they can be grouped with adjacent high ranking segments or other planned construction projects in order to create a more impactful project.

In conclusion, the intent of this document is to provide panning-level data to Town staff in order to help prioritize and improve the pedestrian network. This study demonstrates that the Town of Braintree recognizes the importance of maintaining a high quality pedestrian transportation network for residents and visitors alike. Town sidewalk assets connect the community and Braintree's goal is to maintain and improve them based on a framework that is both transparent and predictable. This document is meant to be a living document and may change as the network and Town needs change.
